Executive Summary Report

Superstore Sales Analysis Using Microsoft Power BI

1. Project Overview

This project was completed as part of the AnalystLab Africa Experience Lab Internship Programme, Week 2. The objective was to analyse the Superstore Sales Dataset using Microsoft Power BI to evaluate sales performance, profitability, customer segments, regional performance, and product trends.

The project aimed to transform raw sales data into meaningful business insights through interactive dashboards and data visualizations that can support informed business decisions.

2. Tools and Methodology

Microsoft Power BI Desktop was used to develop the dashboards, while Power Query was used to clean and transform the dataset. DAX measures were created to calculate key performance indicators, including total sales, total profit, total orders, average sales, and profit margin.

The analysis was presented through interactive visualizations, including KPI cards, bar and column charts, a monthly sales trend, a customer-segment chart, a geographic sales map, and product-level sales and profitability analysis.

3. Key Findings

The analysis revealed the following:

- **Overall performance:** The business generated approximately $2.30 million in total sales and $286,397.02 in total profit from 5,009 distinct orders. The overall profit margin was approximately 12.47%.
- **Regional performance:** The West region recorded the highest sales and profit, followed by the East region. The Central and South regions generated lower sales, presenting opportunities for further investigation and improvement.
- **Customer segments:** The Consumer segment contributed approximately 50.56% of total sales, making it the largest customer segment. Corporate and Home Office customers accounted for the remaining sales.
- **Product category performance:** Technology recorded the highest sales and profit among the three main categories. Office Supplies also generated substantial profit, while Furniture generated considerably lower profit relative to its sales.
- **Sub-category profitability:** Copiers, Phones, and Accessories were among the strongest sub-categories by profit. In contrast, Tables, Bookcases, and Supplies recorded losses, highlighting areas that require further investigation.

- **Product-level performance:** The Canon imageCLASS 2200 Advanced Copier was a notable high-performing product, generating approximately $61,599.82 in sales and $25,199.93 in profit. However, some products generated substantial sales while recording losses, demonstrating that high sales do not always translate into high profitability.

4. Business Implications

The findings suggest that the business should continue supporting profitable product categories and successful regional markets while investigating factors contributing to losses in specific products and sub-categories.

The substantial contribution of the Consumer segment also presents an opportunity to strengthen customer retention while developing strategies to increase sales from Corporate and Home Office customers.

Additionally, the differences in regional performance indicate that targeted strategies may help improve results in regions generating comparatively lower sales and profit.

5. Conclusion

The Power BI analysis provided an overview of the business's sales and profitability and identified important differences across regions, customer segments, product categories, and individual products.

The interactive dashboards make it easier to explore performance indicators and identify areas requiring attention. Overall, the project demonstrates how data analytics and visualization can transform sales data into actionable business insights, helping organizations identify growth opportunities, monitor profitability, and make better-informed decisions.
